3.4	Fidelity	6

Forewords

The content to follow is a collection of my personal interview experiences with various companies, primarily focusing on data science roles that span from old-school statistical methods to modern day transformer architecture.

The summer internship activity started in Jan, 2024 and lasted till Aug 1st (document verification, portal opening, PPTs, and the end-date of the internships). The placement season activity followed really soon, in August itself.

Under the respective major sections, (i.e. placements/internships) the companies are listed in chronological order of arrival/interview. For the interviews taking place on the same day (Wells Fargo and OLA), the order is decided by which one of the interviews started earlier for me.

Disclaimer: The experiences listed below are solely personal. The reader's experiences might be entirely different even for the identical roles as the landscape evolves with time. No generic advice/suggestions are provided in this document, since this is intended to serve as a catalogue of the exchanges that took place. The accounts are jotted down as best as my memory could serve at the time of writing- thus some bits might be missing here and there and some portions might be a little distorted, but I am pretty confident in having been able to capture the crux of the individual cases.

1 Personal Background

Educational Background: MSc in Mathematics, with the Computational and Data Sciences' MTech degree on top.

Final Placements: Did my summer internship in Fidelity on LLM Guardrails (contemporarily very active topic). MTech thesis was on noise characterization of radar observations (partly in collaboration with DRDO). Other projects involved showcasing classical ML proficiency, vision transformer, character level GPT (NanoGPT-Andrej Karpathy). Some 'from scratch' projects like 'linear regression from scratch' etc were also there. And one project on using SVD as image compressor.

Internship: Essence was same, but projects were different and very few- one on live hand gesture recognition, one on customers' behavioral pattern recognition and a simple project of building feedforward neural network from scratch using numpy. SVD project and the other very simple grassroots level projects were present here as well. Nothing was there on the CV regarding GenAI (not even LLMs).

2 Placement Interview Experiences

2.1 Wells Fargo

Role: Quantitative Analyst

Personal View: Involves much more theoretical depth than generic AI/ML roles. Leans heavily towards traditional statistical ways of financial modelling.

Status: Shortlisted through in-person online test (also called hybrid mode). Test venue was EE Department. Was selected for this role. Accepted and Froze.

Interview Mode: Physical ([Venue](#))

Slot: 1st

Interview Description

Round 1:

Educational Background of the Interviewer (only one member): Physics

Project Specific Discussions: Almost none.

- Check number palindrome using and without using strings
- Lily pads grow at an exponential rate over a pond. If it gets filled in days X , what is the number of days till it gets filled given the current coverage is Y
- Familiarity with Fourier Transforms
- How to use Fourier Transforms for solving PDEs
- Heat-Kernel usage for solving heat equation
- Finite difference methods for ODEs
- If $toss \in \{1, 2, 3\}$ take money and game stops. If $toss \in \{4, 5, 6\}$ take money and game continues. Expected reward?

- A matrix A given. Perform $f(A)$ without using repeated direct matrix multiplication, rather simpler arithmetic operations. [Idea/Clarification: If A is diagonalizable, $A = PDP^{-1}$. If $f(x) \in R[x]$ for some ring R , then $f(A) = Pf(D)P^{-1}$. In simpler words, if $f(x)$ is a polynomial the equality holds.]
- What is the density function of $Z = X + Y$, where $X, Y \sim U[0, 1]$

Side discussion: Basic familiarity with random processes. Drift+Diffusion in Geometric Brownian Motion.

Got almost everything right. Whenever I could not be exactly right, I explained intuitively.

Round 2:

Different interviewers (two members), with a long history in this domain. Educational background was MBA (most likely).

- High-level explanation of Internship and MTech projects
- CV looked GenAI inclined. Why more traditional ways? [Reason: My personal background]
- Explain MTech topic a bit more. [Noise is not exactly white, oftentimes an autocorrelated process. Described ways to simulate noise added measurements of a (deterministic) dynamical system with given initial conditions. Also details on AER co-ordinate system used for satellite-pass observations.]
- Explain assumptions for logistic regression. Tell MLE setup.
- Cross entropy loss for perfect classifier
- If all features are zero, find out bias if label is 1, in relation to Logistic Function. [Note: Function, not Regression.]
- Expectation of X conditioned on a filtration of Y [Couldn't solve exactly. But stated the relation to martingales]
- Interviewers affirmed relevance of the tools used in my CV within the domain.
- I asked about good books to get started with. [Recommended Author: Steven E. Shreve]

Personally speaking, I fell short of my own expectations and underperformed. I did not almost anything at all about financial theory, so couldn't exactly get familiar with their line of work. But intuitively I understood their role and my expected responsibilities.

Round 3: HR

- Why two Masters' degrees? Job opportunity in prior degree.
- Why did I not get PPO from Fidelity internship?

- Why not academia/UPSC?
- Preparation mindset/strategy for competitive exam?
- Inquired if I knew the salary structure. Restated the salary structure once again. [I responded that I was aware from the job description on OCCAP portal.]
- Stated that I have to wait till 4-4:30PM for the results.

2.2 OLA

Role: AI/ML Engineer

Personal View: Less theoretical, more of DevOps + AI/ML mix.

Status: Shortlisted through online test. Didn't proceed to the second technical round.

Interview Mode: Virtual (Zoom Call)

Slot: 1st

Interview Description

Started with a generic brief mutual introduction. Interviewer worked on OLA Krutrim LLM related stuff. Asked me regarding the overall architecture of my internship product. As evident from the topic of the internship, it was on safeguarding LLMs from misusages and hallucinations etc; I was also asked about the prospects of its scalability. Then I was asked about my MTech project.

Topic then moved to ViT, the overall patching of the images ([An Image is Worth 16x16 Words](#)) and the high-level overview of the model architecture. Questions on class imbalance scenarios and their possible mitigations.

Conversation then shifted to general very in-depth transformer architecture. Was asked to implement a single self attention unit (used torch). It was being coded live. Then some questions as follows:

- A model with a quite high parameter count is being trained on a small dataset, what is expected to happen?
- How to detect overfitting?
- How to prevent?
- Is accuracy a good metric in all scenarios?
- Explain AUC-ROC.

Finally the coding question:

If the letters in a string s is shifted by a certain fixed amount, say k , then it can act as an encrypter. Write out the functions to produce the encrypted string and from the encrypted string, decode the original given the key.

Possible Cause of Rejection: Unknown. Was very positive about the interview.

3 Internship Interview Experiences

3.1 KLA

Role: Optics Expert with PINNs Experience

Personal View: Mainly a role for a physicist with good grasp on electromagnetism

Status: Shortlisted through online test. Rejected in the first round.

Interview Mode: Physical (OCCAP)

Slot: Open

Interview Description

After a mutual introduction I was told straight away that my resume did not match what they were looking for. Interviewer still asked a few questions from advanced mathematics & basic physics to respect the spirit of the interview. For example:

- Can you please state the Maxwell's Laws?
- How do you solve such equations?
- Are you familiar with Fourier Optics?
- Do you know about the Heine-Borel Theorem?
- Can you please explain the Bolzano-Weierstrass Theorem?

We parted ways on good terms afterwards.

Cause of Rejection: Severe background mismatch.

3.2 Amazon

Role: Applied Scientist Intern (AI/ML)

Personal View: -

Status: Shortlisted through online coding and behavioral test. Rejected straight after the live coding round.

Interview Mode: Virtual (Amazon Chime)

Slot: 1st

Interview Description

DSA Problems asked:

- Suppose students s_1, \dots, s_n must use laptops for $[a_1, b_1], \dots, [a_n, b_n]$ time intervals respectively and no simultaneous sharing is involved amongst students. Figure out the least amount of laptops required to achieve this.
- Binary Tree in-order traversal.

Possible Cause of Rejection: Complete lack of familiarity with even the most basic DSA concepts.

3.3 Flipkart

Role: Applied Scientist Intern (AI/ML)

Personal View: -

Status: Shortlisted through online test. Qualified first technical round. Failed in the second.

Interview Mode: Virtual

Slot: 1st

Interview Description

First Round:

The interview began with a discussion on logistic regression, including its principles/assumptions and how it is optimized. There was a focus on strategies for handling large batch sizes during training, as well as approaches for dealing with categorical variables. The interview further delved into evaluation metrics such as precision, recall, and the confusion matrix. Additionally, the drawbacks of using activation functions like Sigmoid and ReLU in neural networks were discussed.

Second Round: Case Study Round

Suppose you have the *Star Rating*, *User Reviews*, *Search Context*, *Conversion Rate*, *Locations*, *Click Through Rate* for 1000 hotels (say). Can you predict the performance on 1000 other unseen hotels?

Possible Cause of Rejection: Dove head-first into a very crude machine-learning approach without clarifying the metrics, objectives etc. Should have taken more time and prepared the groundwork for building up the case study. Due to lack of awareness, the discussion went quite a bit in circles without making any significant advancements towards the solution idea.

3.4 Fidelity

Role: AI/ML Intern

Personal View: Could've been anything, from GenAI to Statistical Causal Inference.

Status: CV Shortlisted. Selected after two technical and one HR round.

Interview Mode: Physical (OCCAP)

Slot: 2nd

Interview Description

The interview began with a series of technical questions. The first round opened with an introduction, followed by a discussion on a project regarding live hand gesture recognition- probing into its purpose, handling different hand orientations, and the model parameters involved. The interview further explored how the accuracy of class identification was verified, comparing ReLU with Sigmoid functions in neural networks. Then discussion moved onto the project on customer purchase patterns including the features considered and analysis techniques like Cramer's V. There were also questions on statistical tests for association, such as the Chi-Square test, ANOVA, Kruskal-Wallis test, and

MANOVA, as well as the structure of unsupervised learning algorithms applied in the project, including GMM and KMeans.

Note that these statistical tests are not at all strictly necessary to qualify. These are just add-ons to the arsenal of hypothesis testing.

The second technical round began with a similar introduction and focused on topics like implementing backpropagation from scratch, matrix multiplication in neural networks, and the impact of dropout on matrices. Logistic regression and its assumptions were covered, alongside the pseudocode for solving a Sudoku problem. The round also included questions on PCA and the significance of using unitary/orthogonal matrices in the process.

The HR round continued with questions about the candidate's background, projects, motivations for transitioning from academia to industry, expectations from the intern role, and any questions for the company.

The interview concluded with a selection decision. All rounds were conducted in person.
